## **DETAILED ACTION**

### ***Reissue Applications***

The original patent, or a statement as to loss or inaccessibility of the original patent, must be received before this reissue application can be allowed. See 37 CFR 1.178.

### ***Claim Rejections - 35 USC § 102***

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Claims 1-4 are rejected under 35 U.S.C. 102(e) as being anticipated by Nakajima US 5,989,940.

Nakajima discloses a process of forming a flip chip package including providing a substrate (12) member having a plurality of electrical contacts (122a) disposed thereon, providing a flip chip (11) having a plurality of electrical contacts (located between 11 and 11a) disposed on a lower surface, a planar upper surface and a plurality of edge surfaces extending between the lower and upper surfaces, connecting the electrical contacts of the flip chip with selected ones of the electrical contacts on the substrate (via 11a), providing a thermally conductive planar member (20) having a plurality of peripherally disposed edge surfaces, placing the thermally conductive planar member, the flip chip and the substrate member in a mold cavity (105) wherein a predefined portion of the substrate member cooperates with the mold cavity to define a sealable cavity, injecting a moldable dielectric material (15a) into the cavity, curing the moldable

dielectric material and thereby forming a sealed rigid dielectric covering about the edge surfaces of the thermally conductive planar member, the edge surfaces of the flip chip, and the predefined portion of the substrate and forming an encapsulated flip chip package including the thermally conductive member, the flip chip and substrate member, and removing the package from the mold cavity (see figs. 4A-C and related text). Also, disclosed is placing the thermally conductive member in thermal communication with the flip chip by using a thermally conductive adhesive, and that the size of the thermally conductive member is selected so that when it is attached to the flip chip the structure has a height substantially equal to the height of the cavity in the mold.

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.
